Abstract (en)  
[origin: WO2007115806A1] The invention relates to a stackable transport container which is configured such that it can be stacked one above another with other transport containers in a state which is full with goods and can be placed inside one another with other transport containers in an empty state. Grooves (620a-f) which have in each case upper openings and lower groove stops are formed in each case in the left-hand side wall and in the right-hand side wall. A plurality of sliding journals (600a-f) are formed in each case on the outer side of the left-hand side wall and on the outer face of the right-hand side wall. The spacings between the sliding journals are different in the horizontal direction from the spacings of the upper openings (603a-f) of the grooves, as a result of which accidental insertion of an upper transport container into a lower transport container is prevented. Moreover, the spacings of the sliding journals are selected in such a way that dipping of an upper container into a lower container is possible only in one direction.
