Abstract (en)

[origin: WO2007112997A1] There is provided an optical element comprising an optical element body (107.1, 108.1), a reflecting area (107.4, 108.4) and an optical passageway (107.6, 108.6). The optical element body defines an axis of rotational symmetry (107.3, 108.3). The reflecting area is disposed on the optical element body and adapted to be optically used in an exposure process. The optical passageway is arranged within the optical element body and allows light to pass the optical element body, the optical passageway being arranged eccentrically with respect to the axis of rotational symmetry.
