Abstract (en)

A modular construction element (1,1',36, 37, 44, 45, 46) comprises a base (2) having at least one free edge (7,8) and at least one upstanding web (9,10) at a distance (x,y) from the at least one free edge (7,8) to define an offset (11,12), which provides an abutment face (17,18) for a means (20,21,34) for securing the base on a subjacent surface (27,48,49,50). The modular construction element is combined with a plurality of construction elements in an assembling method in which a protective cap is mounted on the upstanding webs to provide an attractive covering, such as a roofing. In the method the modular construction elements are easy to substitute and assemble without making holes in the modular construction elements.
