Abstract (en)
[origin: WO2007116423A1] New hair brash particularly effective in any application where it is necessary to blow a hot air stream towards hair, typically in hair-drying and hair-styling operations, characterized in that protruding, tooth-like or prong-like, components (2) are disposed along the longitudinal axis of the brush. The novel position of the protruding components, as well as their distribution, shape and physical structure, make the hair brush particularly useful in any application where air streams are blown into hair enhancing the effectiveness of the operation. The brush is particularly suitable for short hair dressing. The brash is preferably completely made of plastic material and turns out to be particularly handy, easy to use and to clean and inexpensive.
