Abstract (en)
[origin: WO2007116115A1] The invention relates to a brush element which is intended for use, along with a number of others like it, especially in a circular brush rotatable around an axis of rotation, attachable to the frame of a sweeping machine, and including a head segment which comprises a substantially flat disc assembly provided with a coupling system for coupling brush elements (2) therewith. Bristles (2a') which make up a bristle segment (2a) for the brush element are coupled for an integral unit with a body segment (2b) connecting the same. The brush element has its bristles (2a1) coupled with the body segment (2b) in a configuration tapering in a substantially conical manner towards one end (II) of the body segment (2b) in its lengthwise direction (s) as viewed from above.
