Abstract (en)
[origin: WO2007107019A1] In order for it to be possible, in a jet-weaving machine, for the air outlet quantity to be controlled simply and with quick reactions at the main nozzles (12, 13, 14, 20), in which the weft threads are fed and accelerated by means of a blowing medium, if need be also at the echelon and stretching nozzles (21, 22, 23, 30; 31, 32), it is proposed that the main switching element ($H_{₁-H_{_n}}$) comprises a multiplicity of part switching elements ($T_{₁} \dots T_{₉}$) which can optionally be connected and in each case make a dedicated mass blowing flow available. The mass blowing flow can be set in a stepped manner by adjustable addition of the part switching elements ($T_{₁} \dots T_{₉}$).
