Abstract (en)  
[origin: WO2007115868A2] The invention relates to a refrigerating device comprising a body, a first door and a second door (4, 5), where one of their respective edges is fixed to the opposite side of the opening of the body (1), and a beam (7) which is joined to one edge of the first door (5) which is opposite the fixed edge of said door. The beam (7) can be pivoted with the aid of a guiding projection (13) which can be displaced in a guiding groove formed on the edge of the opening, between a position (15) adopted when the first door (5) is closed, in which one edge of the second door (4), which is opposite the fixed edge of said door, is applied to the beam (7), and a position which is adopted when the first door (5) is open, wherein the beam (7) can pass to the closed second door. The guiding projection (13) can be displaced in relation to the first door (5) in the direction of the pivotable axis (8) thereof.
