Abstract (en)

[origin: WO2007119145A2] The invention relates to an initialisation method for initialising a domestic automation device comprising a control unit for AC supply to an actuator for the displacement of a roller blind between an extreme low position and an extreme high position, characterised in having at least the following steps: positioning the roller blind in a starting position such that the force required to drive the roller blind upwards to the extreme high position is less than the maximum force which the actuator can provide when supplied with a reduced voltage, adopting an initialisation mode to determine the extreme positions, initial displacement of the roller blind from the starting position by supplying the actuator with a reduced voltage until a first extreme position is achieved and measurement of the time taken for the first displacement.
