Abstract (en)

[origin: WO2007109694A2] A software and/or hardware facility for scoring the quality of traffic to a site accessible via the Internet or other network. The facility may generate training set data and use the training set data to identify parameters indicative of fraudulent traffic to a site and reduce the effect of fraudulent traffic on advertisers and publishers. The facility may score the quality of traffic to a site by evaluating various parameters associated with the traffic and determining combinations of parameters that are indicative of the quality of traffic to the site. Traffic to a site may be scored based on the combinations of parameters associated with the one or more sessions. Lower scores are indicative of traffic having little value to a publisher, advertiser, or third party; higher scores are indicative of traffic having greater value.
