Abstract (en)

[origin: WO2007107241A1] A cryostat (1) having a magnet coil system, which comprises superconductive conductors, for producing a magnetic field $B₀$ in a measurement volume (3), having a plurality of solenoid-like coil sections (4, 5, 6), which are arranged nested radially one inside the other and are connected electrically in series and of which at least one LTS section (5, 6) comprises a conventional low-temperature superconductor (LTS) and at least one HTS section (4) comprises a high-temperature superconductor (HTS), wherein the magnet coil system is located with liquid helium in a helium tank (9) of the cryostat (1) at a helium temperature $T_L < 4 K$, is characterized by the fact that heating means are provided which keep the HTS at any time at an elevated temperature $T_H > T_L$ and $T_H > 2.2 K$. The HTS section can be used in the long term and reliably in the cryostat according to the invention.
