Abstract (en)
[origin: EP2006099A2] The press has printing units convertible between different printing processes. Each printing unit has a receiving element for releasably connecting and receiving a printing unit subassembly or a printing unit component for implementing a printing process on a web of printing material passing through the printing unit in a nip. The receiving element executes a linear movement perpendicular to an engagement direction for tilting an axis of rotation of the cylinder relative to an axis of rotation of an impression cylinder.
