Abstract (en)

The invention relates to the provision of a closure system for a drain hole of a bath, sink or the like. The system comprises a closure means (12) which is movable between an open drainage position and closed sealed position. The movement is controlled by a movement assembly (14) mounted in connection with the closure means (12) so as to allow the movement to be achieved without direct contact between the user and the closure means (12) being required. Typically one or more user operable switches (220) or remote control means are provided to allow the selective movement of the closure means by the movement assembly to be achieved.
