Abstract (en)

[origin: WO2007112520A2] The implantable device is composed of a hollow body (1, 11) provided with a connector piece (7, 17) for a catheter (6, 16) and closed at its other end by a leaktight membrane (5, 15) intended to be pierced by a needle for administration of therapeutic substances. The hollow body (1) has a substantially cylindrical shape and is provided with at least one stabilizing element (8, 18) that can extend beyond the external diameter of the body (1, 11). The implantable venous perfusion device is particularly suitable for use in the treatment of diseases that require repeated injections of toxic substances, such as the substances used for chemotherapy.
