Abstract (en)

A hollow shaft (113) is provided with a hinging projection (115) at one of its ends, to which a boom (116) having an operative free end is pivoted. A hose (117) is slidably received within the hollow shaft (113) and has an outlet end (118) anchored to the operative end of the boom (116) and an inlet end connected to pressurized fluid supplying means. A slide (122) is integral with the hose (117) and is slidably supported in a longitudinal direction with respect to the hollow shaft (113) under control of translation driving means (114, 121). The slide (122) and the boom (116) are interconnected via rigid linkages (26) arranged to change the translatory motion of the slide (122) into a rotary motion of the boom (116) about the pivot axis thereof.
