Abstract (en)

[origin: EP2008815A2] The method involves applying a fluid during rotation of a rotation body (2) in pulses, and simulating a topographic fluid allocation of the rotation body after surface covering and film thickness are equivalent in a mathematical model. Duration of the pulses or distance between the pulses is adjusted depending on the simulated fluid allocation. The topographic fluid allocation is simulated regarding a film division in the model. An outer circumferential surface of the rotation body in the model is divided into lines. An independent claim is also included for a device for applying fluid to a rotation body of a printing machine.
