Abstract (en)
[origin: WO2007113378A2] A method for water distribution in which water is conducted via a pipe system from a waterbody such as a river to the place of use in such a way that the water pipeline is at least partly a feeding pipeline, from which the water is conducted via branch pipes, the so-called distribution pipes or hoses, to the places of use, that the intake point of the water running in the pipe system has been set higher than the water outlet point at the place of use, and that the outlet end of the main feeding pipe in the river is closed or the water flow via the lower end of the pipe has been otherwise limited by choking the flow, thus creating pressure inside the feeding pipe as well as the distribution pipes, which causes the water to flow out of the outlet of the distribution pipes, e.g. a hose nozzle, for distribution.
