Abstract (en)
[origin: WO2007121724A2] Disclosed is a motor vehicle door lock comprising at least one locking mechanism, a first lever, a second lever, and a drive unit with an electromotive drive, for example, and a rotatable actuator. The drive allows both the first lever to be transferred from a first functional position into a second functional position, and vice versa, and the second lever to be transferred from a first functional position into a second functional position, and vice versa, by means of the actuator. The inventive motor vehicle door lock is characterized in that the first lever and the second lever are interconnected via a coupling lever.
