Abstract (en)
[origin: WO2007118758A1] The invention relates to a synchronization device for an engine, said device having a first active sensor and a second active sensor. The first active sensor is adapted to detect a first relative position of a first shaft and the second active sensor is adapted to detect the relative position of a second shaft. The first active sensor and the second active sensor are adapted to supply the control device with information on the nature of the relative position of the first shaft and of the second shaft or the relative position of the first shaft and the phase position between the first shaft and the second shaft. The control device is further adapted to supply a control signal for adjusting a definable phase difference between the first and the second shaft.
