Abstract (en)
[origin: WO2007122076A2] The invention relates to a telescopic slide for a refrigeration device, comprising at least two rails (14, 15) that can be displaced towards each other in the longitudinal direction while being guided one on the other. A support (11) having a tolerance is mounted on the first rail (14). The contact surfaces between the support (11) and the first rail (14) have a large coefficient of friction in order to prevent the support (11) from sliding to and fro on the rail (14).
