Abstract (en)

[origin: WO2007104868A2] The invention concerns a device for communication between an electronic module (110) provided with a programmable controller and a remote server (140), comprising: means for associating the electronic module with a device (100) such that said module receives signals representing operating states or parameters of said device via at least one connector (103), a communication server application on said electronic module, said communication server application being capable of automatically communicating with said device as well as with said remote server via at least one communication means (120, 125) and a communication server application on said remote server for making it capable of automatically communicating with said electronic module via at least one communication channel via at least one communication means (155, 160). Each of the server applications is capable: of deciding the transmission of a request to the other server application, based on a predetermined criterion, said remote server and said module being thus capable of transmitting a request addressed to said module or to said remote server, respectively, following said decision; and upon receiving said request, to cause a reply to be transmitted to the other server application, said module and said remote server being thus capable of transmitting to said remote server or said module, respectively, said reply encapsulating data or parameters of said device.
