Abstract (en)

[origin: WO2007118637A2] The invention relates to a method for triggering an electronic image reproduction device comprising N>3 individually controlled color channels, by means of which N primary colors are defined, the colors being additively mixed from said N primary colors. One or several pre-calculated two-dimensional tables, in which the values required for controlling N color channels are stored under the addresses of a color type of the colors that are to be reproduced and are retrieved during operation, are used for real-time processing.
