Abstract (en)

[origin: WO2007118891A1] The invention relates to a method for restricting the access to data of group members of a service subscriber group. Group members of a service subscriber group are each assigned an identifier. The data of the group members are assigned to the identifier in each case and the data of the group members are stored in a data memory (DS2) of a group management computer (GR) which manages the service subscriber group. Applying the method, a first group member requests a service, providing the identifier of a second group member, the performance of said service requiring the data of the second group member. The identifier of the second group member is sent to the group management computer, which verifies whether the requested service using the data of the second group member is authorized, and in the case where an authorization exists the data of the second group member are sent to a service computer (DR1) controlling the performance of the requested service. The invention also relates to a group management computer.
