Abstract (en)

[origin: EP2011735A1] The device has a hollow cylinder (6) that adjusts development and tension of a plastic film sleeve (5), where the sleeve is rolled around the cylinder and a hollow cylinder (1). A blowing box (9) has a surface perforated on a surface (9'). A row of stores (15) supplying the objects are implanted around the sleeve in rolled position around the cylinder (1). Return cylinders (11, 12) apply a sheet of material (10) that synchronously moves along with the sleeve. The objects are adhered on the material that is arranged parallel to the sleeve on a section between the cylinders (11, 12).
