Abstract (en)

[origin: EP2012277A1] The system has a storage unit for storing characteristic data of an equipment and input data of another equipment in a personalized file. The former equipment is constituted of a hand washing and disinfecting unit (3), an access control device (7) and a passage detecting device (8), and detects and identifies an identification module e.g. radio frequency identification (RFID) strap, carried by person. A data control unit compares the data contained in the file with data in a reference file having tasks to be performed by the person, and indicates non potential matching between the files.
