Abstract (en)

[origin: WO2007126353A1] A device (1) for feeding web material through a processing installation comprises a conveyor belt (28) which has a first segment (30) and a second segment (32). An opening roller and a guiding surface are adapted for unfolding the conveyor belt (28) by means of separating the first and second segments (30, 32). A spreader roll (12) is adapted to keep the conveyor belt (28) unfolded while a tail (58) of said web material is placed on said first segment (30). A folding roll (26) is adapted for folding said second segment (32) over said first segment (30) for to enclose the tail (58) in the conveyor belt (28). The spreader roll (12) comprises a first roll portion, a second roll portion and a circumferential guiding track separating the roll portions. The first roll portion, which is adapted for supporting said first segment (30), has a cylindrical outer surface (16).
