Abstract (en)
[origin: WO2007121605A1] The invention relates to a laptop computer with at least one first body component (23) constituting an interface (33) and one second body component (25) constituting a display (35) that can be swiveled on the axis of a joint (21) around the first body component (23) and connected to it. The two body components (23,25) together form the body of a computer. The body of the computer contains at least a CPU, a data storage module, and an energy storage device. In addition, a docking module (27) is provided that can be connected to the body and disconnected from the body of the computer with a plug connection and that features at least one network device and one drive. This can be disconnected from the rest of the laptop. In addition, the first body component, the second body component, and the docking module form three flexibly interconnected body components (23,25,27) that can be opened in a Y-shaped way so that two body components (23,27) serve as a stand for the body component (25) that is provided with the display (35).
