Abstract (en)

[origin: WO2007125254A1] This invention concerns a telecommunication system SYST which includes a server SRV linked to a terminal TO via a communication link L0. 5 According to the invention, the terminal TO includes the identification means RGM of a selected object OBJ2 displaying an identifier Id2 associated with a memory storage area where at least a set of information IS2 has already been stored on request from a party INT2 with permission to communicate with a user of terminal T0, and the system 10 SYST includes the broadcast capacity, via the communication link L0, of information IS2 that has already been stored upon request of party INT2 associated with the selected object OBJ2. The invention makes it possible to conduct an easy to use interface, because a simple presentation to the identification means RGM of an object displaying the identifier OBJi 15 allows the user of the terminal to access memory storage containing sets of information which are intended for him.
