Abstract (en)

[origin: US2009183467A1] A device for folding in at least one flap of a box includes a folding mechanism for folding the at least one flap and a pressing mechanism for pressing the flap into the inside of the box, where the pressing mechanism projects into the inside of the box. The flap is closed with only the two tool. Particularly by the use of the pressing means, the flap can be pressed against until such time as glue, applied in the preceding step, has bonded. To adapt to different widths of the package, only one tool has to be exchanged. The folding means need not be changed, since it is adapted for the widest possible package.
