Abstract (en)
   [origin: WO2007128363A1] The invention relates to a closing device for closing a container, comprising a rotary bar (16), which can be fastened on
   a first container element such that it can be rotated between a release position and a blocking position; comprising at least one closure part (18),
   which can be fastened on a second container element, which can be moved between an open position and a closing position, where the rotary bar
   (16) is arranged within a closing recess (28) of the closure part (18), and which, in the closing position, can be pivoted about the rotary bar (16)
   between a closed pivoting position and an open pivoting position; wherein the rotary bar (16) has a profile which is configured such that the closure
   part (18), in its closing position and in the blocking position of the rotary bar (16), is supported against the rotary bar (16) by way of a supporting
   surface (30); and wherein the supporting surface (30) has an undercut (33) which is configured such that the closure part (18) can be pivoted from
   the closed pivoting position into the open pivoting position and the closure part (18) is supported against the rotary bar (16) by way of the supporting
   surface (30) and is retained against moving in the direction of the open position.
