Abstract (en)

[origin: EP2017011A1] The container has an atmospheric pump connected with a riser pipe (3) and engaged in the container to suck and deliver a container capacity. A hollow region (5) is formed in a container base, where the riser pipe has a sufficient length such that free ends of the pipe engage in the hollow region. A small gap is present between the free ends of the riser pipe and a base of the hollow region. The hollow region has a cross shape that is formed from two cross laminar channels, where the hollow region is confined by an inclined wall section (6), and the container is made of plastic.
