Abstract (en)

[origin: US2009001663A1] The invention relates to a drawing mechanism with a variable regulation device for regulating the probabilities of winning. The mechanism, intended to be associated to two or more entertainment machines, all of them forming a type of game table or counter, is formed from a drum, in which a predetermined number of balls are arranged, which drum can be transparent or like a cage, for allowing in any case the player or players in question to see the balls contained therein, provided with fixing means for fixing it to the mentioned game table, with a horizontal rotating shaft arranged inside the drum and in which a drive mechanism is arranged which allows rotating the drum in either direction. Said drum equally has a protrusion in the shape of a protruding turret located on a plane of symmetry perpendicular to the rotating shaft, and with suitable dimensions for allowing the passage and housing therein of at least one of the balls. The balls never abandon the assembly formed by the drum and the turret.
