Abstract (en)

[origin: EP2017798A1] The device has a disbursing element (54) movable in a base of a coin tube during angular rotation of a disbursing disk (20) along a curved slot in order to detect and push the lower coin. An electrical drive motor has a control device for controlling the drive motor such that the disbursing disk is twisted from a resting position to an end position around a defined rotation angle and afterwards turned back to the resting position. The disbursing element has an extension in rotation direction, and a coin support rests on the disbursing element in the end position of the disbursing disk.
