Abstract (en)
[origin: WO2007128910A2] Intraocular implant intended to be implanted in a capsular bag comprising a substantially circular disk-shaped optic (2) having a dimension smaller than the substantially circular disk-shaped interior volume of the capsular bag; and at least two tabs (6, 7) forming haptics distant from one another and protruding radially from the optic, characterized in that the exterior end edges of the at least two haptics are joined together by two ring segments, whereby the exterior end edges and the ring segments form a ring which, as a projection within the optical plane, extend completely around the periphery of the optic.
