Abstract (en)

[origin: WO2007131922A1] The invention concerns a mount (3) fixed to the vehicle, on which brake linings (4) and at least one brake caliper are mounted with axial mobility, wherein the mount and brake caliper encircle at least one brake disk, and wherein the brake caliper (2) has a housing leg with at least one actuating device, another housing leg with at least one housing finger, and a housing bridge, with a spring system (5) that produces elastic initial tension between the brake caliper (2) and mount (3) in such a way that the initial tension is essentially oriented perpendicular to the displacement direction of the brake caliper, and wherein the spring system comprises a spring element (5) and a guard screen (7), wherein the housing finger, the spring element, and the guard screen are arranged axially with respect to one another in such a way that the spring element is positioned between the housing finger and guard screen. Thus the guard screen functions as a caliper screen and advantageously covers a substantial part of the spring system.
