Abstract (en)
[origin: EP2019158A1] A needle frame comprises at least one forming apparatus (3) for a textile product (P). The apparatus (3) has first devices (P1) designed to intercept a plurality of warp threads (O) fed to a bearing plate (4) for formation of the textile product (P), second devices (P2) designed to intercept at least one weft thread (T) fed to the bearing plate (4), at least one sickle (11) to carry the weft thread (T) transversely of the warp threads (O), third devices (P3) designed to temporarily retain the weft thread (T) carried by the sickle (11), and a reed (20) for compacting the weft thread (T) against the already formed textile product (P). There are dedicated fluid-operated or electromechanical actuators (21) and they are operatively connected to each of the first devices (P1) and/or each of the second devices (P2) and/or the sickle (11) and/or each of the third devices (P3) and/or the reed (20) to move the first devices (P1) and/or the second devices (P2) and/or the sickle (11) and/or the third devices (P3) and/or the reed (20).
