Abstract (en)  
[origin: WO2007128094A1] A core adapter (10) formed as a hollow cylindrical sleeve (12). A plurality of radial apertures (13) are formed in the sleeve. Each radial aperture is perpendicular to the sleeve's axis (20). Studs (14) are provided in each aperture, initially recessed beneath the sleeve's outer surface. The sleeve's outside diameter (28) is sized for insertion into a 6-inch inside diameter core (310). The sleeve's inside diameter (30) is the same size as a 3-inch inside diameter core. The adapter is inserted into a 6-inch core until it is flush with the end of the core. Wedge-tipped bars (194) are driven beneath each of the adapter's longitudinally aligned rows of studs, against the bottom (18) of each stud, thereby driving the studs perpendicularly away from the sleeve's axis into the roll core.
