Abstract (en)  
[origin: EP2020278A1] The handle (10) has a rear part including a rounded shape provided with a double wall (10.7) and an inner deformable chamber (C), after installing a body (11) of a striking hand tool e.g. hammer. An elongated folded bellow shape (10.6) has an end penetrated and anchored in a groove of the tool body, in an inclined position. The shape (10.6) permits the handle to absorb deformations generated by the tool and different ripples of a plastic sleeve, and the end permits the handle to be anchored to the tool body to authorize deformation movement of the shape (10.6), during striking operation.
