Abstract (en)
[origin: EP2020474A2] The lock, particularly a shackle lock, has lock housings (15,21), where a free space (45) is provided in an axial extension of a lock cylinder (27). The lock cylinder or a part of the lock cylinder is shifted from an operating position into the free space by a pre-determined force impingement in the axial direction of the lock cylinder. The lock cylinder or a part of the lock cylinder takes sabotage position, in which the coupling of a latch (19) sets a cylinder core (33) out of function.
