Abstract (en)

[origin: WO2007128915A1] Device for extracting any plant contained in a pot or any other container. The invention relates to a device that makes it possible to transplant any plant without difficulty and enabling better regular upkeep of the plant. It consists of strips (1) arranged in a corolla connected at their centre by a removable tie (5) and connected at their ends by a rope system (3) to modulate the diameter of the device according to that of the pot. The device is arranged such that the tie is placed at the bottom of the pot and all the strips cover the walls of the pot forming a mould (9) around the soil (7) and the roots of the plant (8) planted. If the user wishes to extract the plant, he pulls towards the outside of the pot on the rope system remaining externally accessible and the device coming out of the container. In order to facilitate the extraction of large plants, it is provided to leave one strip (1) of the removable tie (5) free, thus serving as a loop (9) and handle (10) during extraction.
