Abstract (en)

[origin: WO2007138045A1] The invention proposes a feeding bottle, comprising a lower body, which comprises a neck and on the body a ring for fastening the teat, which includes an annular lateral cylindrical apron (52), which is fixed onto the neck using bayonet-type devices, characterised in that the bayonet-type fastening means include a minimum of a lug (68), which extends to the internal surface (64) of the apron (52) and at least an 'L'-shaped groove (26) suitable for receiving the lug (68), and in that the internal surface (64) of the ring includes a series of ribs (72) formed in relief, which cooperate with the opposite portions of the lateral external convex surface (24) to radially centre the ring with a radial play (J), relative to the neck.
