Abstract (en)

[origin: WO2007135501A2] The present invention relates to a spacer element (10, 10') for making formworks and laying building structures, of a type comprising a substantially rectangular body, said body comprising a first end region (11), a second end region (12) and a central region (13), said first (11) and second (12) end regions being located on opposite sides relative to said central region (13), said spacer element (10, 10') comprising a plurality of tangs (14) having bent portions protruding from the profile of the spacer element (10, 10'), which allow a predetermined distance to be kept between panels adapted to make up concrete casting formworks. The invention is characterized in that, in the transition from said first end region (11), respectively second end region (12), to said second end region (12), respectively first end region (11), each tang (14) of said plurality of tangs (14) is located downstream, respectively upstream, of a shearing area (15).
