Abstract (en)

[origin: WO2007138006A1] The invention relates to a transmission for transmitting a drive torque from one drive shaft (2) to two output shafts (3, 5) by means of a differential unit (15) and a continuously variable device (14) for influencing the distribution rate of the drive torque to the output shafts (3, 5), said device being activated by means of at least one motor (37). According to the invention, the motor (37) is situated in relation to a central transmission axis (Y), which runs perpendicularly to a longitudinal axis (X) of the output shafts (3, 5), in such a way that the end of the motor having a motor shaft output (98) faces away from the central transmission axis (Y).
