Abstract (en)

[origin: CA2653123A1] The present invention relates to an air navigation device with inertial sensor units and three-measuring-channel radio navigation receivers. It is characterised in that in two (10,12) of the three channels the inertial measuring units are ~low performance~ type MEMS with approximately 1°/h to 10°/h class gyro, the third channel comprising an inertial measuring unit (15) performing in compliance with standard ARINC 738.
