Abstract (en)
[origin: US2010291300A1] The invention provides a device and a method for coating wheel rims, which allow the production of both standard rims and special rims, configured as gloss-copied rims. The device comprises a pre-treating station that is followed by a powder priming station followed by a basecoat application station and a final coating station, in particular an acrylate powder station, the final coating station being coupled to both the powder priming station and the pre-treating station by at least one conveyor, respectively. The system permits a proportion of special rims to be introduced in addition to standard rims without any impairment of the spindle-synchronous operation of the device.
