Abstract (en)
[origin: WO2007131562A1] The present invention relates to a clamping device (4) for clamping threads on a spindle of a spinning or twisting machine, the clamping device (4) being arranged on a top spindle part (1) and comprising a fixed clamping element (5) and an axially displaceable clamping element (6) which can be pressed by a spring force against the fixed clamping element (5), wherein centrifugal-force elements (9) can bias the displaceable clamping element (6) counter to the spring force by means of a force which spaces the displaceable clamping element (6) apart from the fixed clamping element (5) in the axial direction such that a clamping nip (16) forms between these elements and wherein the clamping device (4) has holders which serve for accommodating and guiding the centrifugal-force elements (9), the holders for the centrifugal-force elements (9) being arranged on that side of the clamping device (4) which is located opposite the clamping nip (16), and a compression spring (8) being arranged between the holders and the clamping nip (16).
