Abstract (en)
[origin: WO2007135066A1] An internal combustion engine (10) comprises a plurality of cylinders (12a-12d). The fuel is introduced into their combustion chambers in a cylinder-specific manner. It is proposed that a desired fuel quantity ($q_{\text{SUB>oll</SUB>}}$) be varied in a cylinder-specific manner during a period ($t_{\text{SUB>E</SUB>}}$) in such a way that the average value formed over the period ($t_{\text{SUB>E</SUB>}}$) corresponds at least approximately to a normal desired fuel quantity ($q_{\text{SUB>oll_norm</SUB>}}$) which would have to be injected without said variation in order to bring about or maintain a desired operating state of the internal combustion engine (10).
