Abstract (en)
[origin: WO2007134302A2] An input is received for an address field of a message that is to be transmitted from a messaging application. A contact record is associated from the input with the message. A recipient address is selected from the identified contact record for use as an address field value. An input is detected from the user, and subsequently, the user is enabled to edit the address field value. In one embodiment, the user is enabled to edit the address field value by either allowing the user to select a new recipient address from the identified contact record, or by allowing the user to create an alternative recipient address that is not part of the contact record.
