Abstract (en)

[origin: WO2007140489A1] Method for connecting a first electrically conductive component in the form of a flexible electrical line (1) which has a plurality of wires (11) to a second electrically conductive metallic component, for example a second electrical line (2) or a connecting element. In this case, the free end of the flexible electrical line (1) is inserted into a sleeve (3) and is compressed with it and, furthermore, that end of the second electrically conductive component (2) which is associated with the flexible electrical line (1) is inserted into the free end of the sleeve (3) and is brought into contact with the flexible electrical line (1) and electric current is passed through these two components (1, 2) as a result of which their ends resting on one another are fused, with the sleeve (3) being produced from a metal which has a higher melting point than the metal(s) of the two components (1, 2) to be connected to one another.
