Abstract (en)

[origin: EP2025513A2] The method involves integrating an alignment of an interference of each control unit in a compensation curve. The alignment depends on the rate of production of a printing machine. The interference of each control unit is conducted in the level of the printing material. The compensation curve increases in the starting area of the printing machine with a large increase than the compensation curve with reversed sign in an acceleration area till its maximum rate of production drops.
