Abstract (en)

[origin: EP2025811A1] The method involves calculating an absolute stroke for a leveling cylinder (Z) from a new actual differential measurement value and from an input construction ratio factor. The ratio factor is adjusted for the calculation of the absolute stroke by a self-learning construction ratio controller (R1) until a predetermined minimum value of the differential measurement value is reached. A new leveling cylinder adjustment position is selected as a new zero point (NP), and the predetermined minimum value is set to zero in a regulating system (R), when the predetermined minimum value is reached. An independent claim is also included for a regulating system for adjusting elevation position of a road paver, comprising a paving screed.
